

Electric Toothbrush

ABSTRACT

5

A brushing attachment for an electric toothbrush includes an elongate neck, a head at an end of the neck, a tuft block located at the head and having bristles parallel to an axis extending in a direction substantially normal to 10 the neck. The tuft block is mounted to the head so as to be movable linearly along the axis and pivotally about the axis. There is a recess in the tuft block facing toward the neck. A driveshaft extends through the neck and has and angularly offset arm received within the recess to 15 effect movement of the tuft block.
